SCIENCE

COMPSCI 714
Lecture 1: Welcome to the course!

Course structure and a short approach to AI

Instructor: Thomas Lacombe

What to expect?

- In this course, you will:
  - Gain knowledge about underliying methods used to develop AI systems.
  - Get practical experience in training and evaluating AI systems based on Deep Neural Networks (DNNs), using well known frameworks.
  - Get familiar with well known DNNs architectures used for different type of data.
  - Gain knowledge and get practical experience with some of the latest developments in the field (Generative AI, Multimodal AI).
  - Get insights from research and industry experts with several guest lectures and tutorials.

Teaching team

Thomas Lacombe (course coordinator)

Lecturer for the first half of the course

Room: 303-419 (City Campus)

Office hours: On request

thomas.lacombe@auckland.ac.nz

Qian Liu

Lecturer for the second half of the course

Room: 903-422 (Newmarket Campus)

Office hours: On request

liu.qian@auckland.ac.nz

Roshan Sofi

Course Tutor/Marker

rsof418@aucklanduni.ac.nz

Maryam Khakpour

Course Tutor/Marker

amhk067@aucklanduni.ac.nz

Fiona Marie Bautista

Course Tutor/Marker

fbau775@aucklanduni.ac.nz

My background

PhD in E.Eng. in 2018, at USMB/CUGA, France

- Industrial computer vision and ML for automatic visual quality control
- Feature engineering, feature selection

Postdoc at UoA in 2019-2020

- Automated hyper-parameter tuning for machine learning with data streams

Since 2021

- Teaching fellow in the School of Computer Science
- Interest in interactions between Generative AI and education

UNIVERSITÉ SAVOIE MONT BLANC

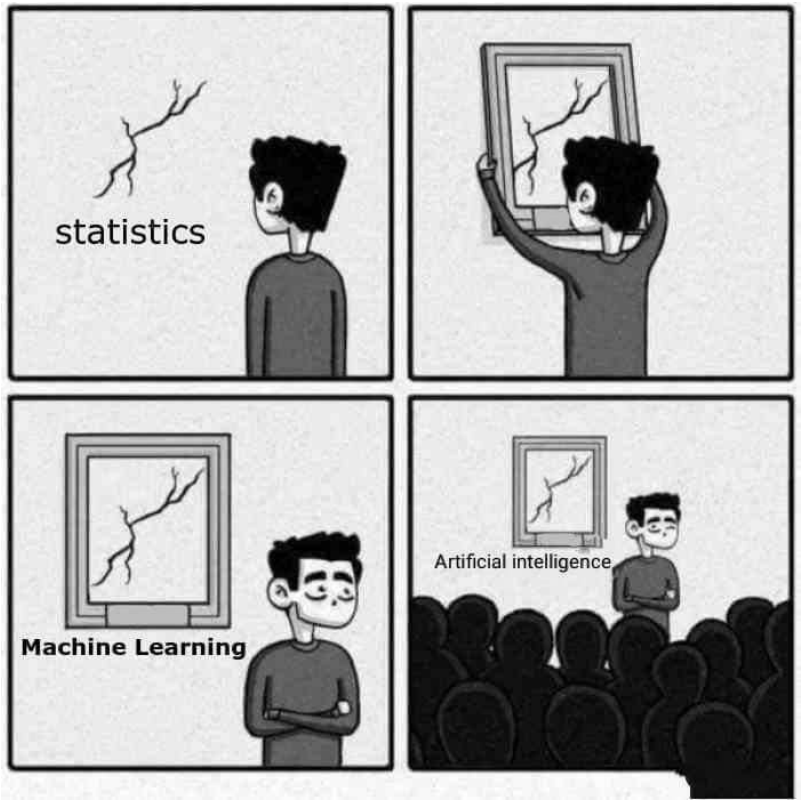
Communauté UNIVERSITÉ Grenoble Alpes

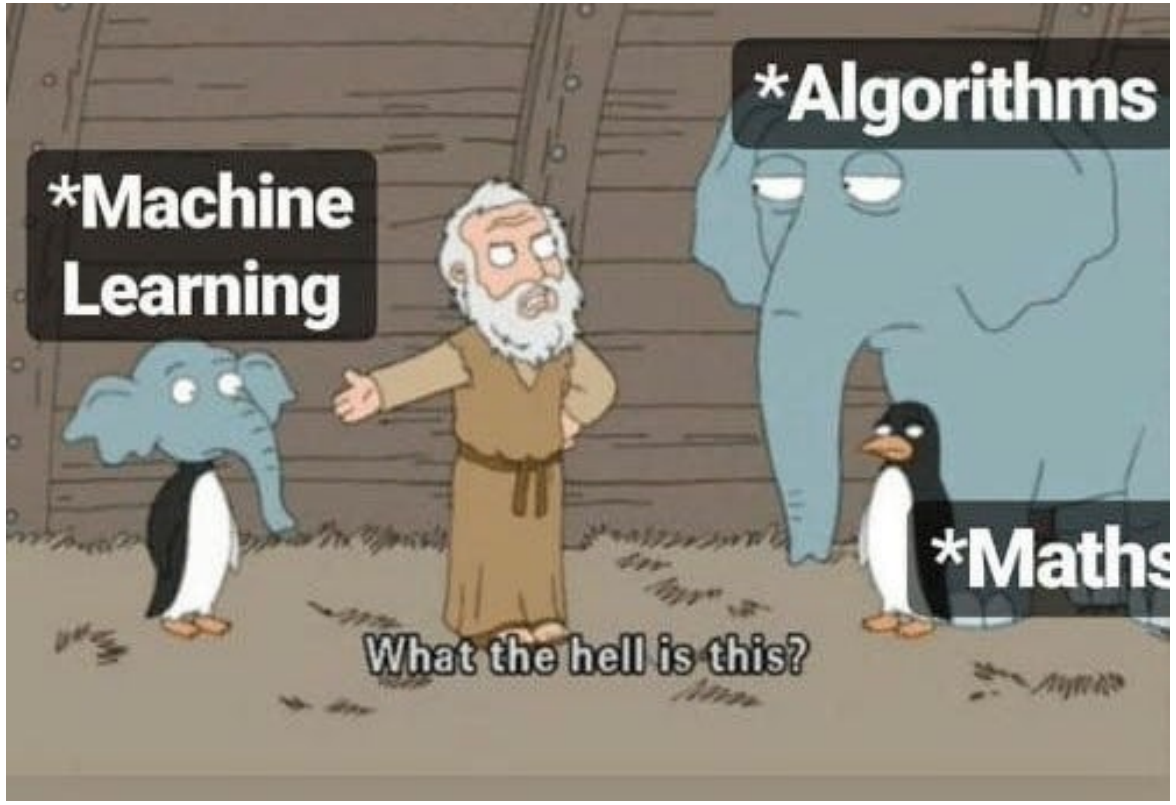
https://scikit-ika.github.io/

Before we start: course pre-requisites

- We designed this course to be practice oriented.
- We expect students to be familiar with Python and coding using notebooks.
- Make sure you follow the instructions in the Canvas Hei tīmata | Start Here page to get set up!
- If you have limited experience with Python, we highly recommend you go through some of the tutorials listed in Canvas.
- Some base knowledge of math concepts covering calculus, linear algebra, probabilities, and statistics, is also recommended.

AI: a math story?





Join at menti.com | use code 6846 5907

Mentimeter

How would you evaluate your programming skills before starting COMPSCI 714?

Programming skills in at least one programming language.

Programming skills in Python.

g skills in Python for data science and/or machine learning.

e new to this)

Very experienced

Admin I: Communication in the course

- **Teaching team to students**:

  Canvas Announcements
  - Check them/your UoA email daily (please make sure that your personal notification settings is set to ASAP for announcements).

- **Students to teaching team**:

  Ed Discussion Forum & Email
  - Ed Discussion forum for general course questions, e.g., content related, general admin question.
  - Email for specific/private/urgent requests/meeting request.

- **Email guidance**:
  - Email the right person: course coordinator (admin-related) vs. lecturer (content-related)
  - Use descriptive email subjects: [CS714] subject of the email
  - Be short & to the point, while providing enough background information.
  - Make sure the answer to your question is not given on the Canvas home page, class announcements, or the class discussions on Piazza before emailing.

- Please follow the school guidelines for communication and course expectations.

Admin II: Lecture/tutorials

When	Where
Tuesday 9am to 10am (lecture)	MLT2/303-102
Friday 9am to 11am (lectutorial)	ClockT039/105S-039

- In general:
  - Tuesday: Lectures (in-person)
  - Friday: Lectutorial (in-person)
- This might vary for some weeks (see up-to-date info in the Course Schedule).

- Bring a personal laptop in lectutorials (at least) as there will be programming activities! Notebooks will be shared on Canvas.

Admin III: Assessments

Assessment Group	Weighting
Individual Assignments (4 in total)	10% x 4 = 40%
Group Project / Hackathon (second half of the course)	30%
Mid-semester test (week 7)	10%
Final Exam	20%

- To pass the course, you need:
  - 50% overall
  - 50% of the practical part (individual assignments + group project), i.e. 35/70 over the 4 assignments + the group project.
  - 50% of the theory part (mid-semester test + exam), i.e. 15/30 over the test + the exam.
- More information about the assignments and group project will be released soon.

Course policy on using Generative AI

- You are allowed to use Generative AI to support your learning. However, the use of such tools will not be allowed in all assessed activities:
  - Individual assignments: Authorised
  - Group project: Authorised
  - Test (in-person, on paper): Not authorised
  - Exam (in-peron, on-paper): Not authorised
- If you use generative AI tools in assignments and project, we encourage you to self-reflect about your use of such tools. This might include an acknowledgment statement. You can learn more about this on the Canvas Course Policy on GenAI page.

No lecture/tutorial

Admin IV: Tentative schedule and topics

Week	Tuesday (9-10am)	Friday (9-11am)
1	Intro lecture (all the team is welcome to join)	Lectutorial: Data basics
2	Lecture: NN and DNN basics	Lectutorial: Training and evaluating a DNN
3	Lecture: Design choices	Lectutorial: Hyperparameter tuning and regularisation
4	Lecture: Architectures for Sequential data	Lectutorial: RNNs and Transformers
5	Lecture: Architectures for Image data	Lectutorial: Convolutions, CNNs & ViT
6	Lecture: Parallel/GPU computing	Guest lectutorial on Cloud Computing (TBA)
Break	2 weeks	
7	Lecture: Transfer Learning	Lectutorial: Transfer Learning
8	Lecture: Transfer Learning (Pretrained Foundational Models)	Lectutorial: Transfer Learning and Finetuning Pretrained Models
9	Lecture: Generative AI	Lectutorial: Generative AI
10	Lecture: Generative AI and Large Language Models	Lectutorial: Generative AI and Large Language Models
11	Lecture: Multimodal AI	Lectutorial: Multimodal AI
12	Guest lecture - AI applications (TBA)	Guest lecture - TBA

Class rep

- The class rep act as an intermediary between students in the class and the lecturers and tutor.
- You can share with them any suggestions / complaints / remarks about the lectures.
- Class rep can organise communication between students (e.g. create social media chats).

- It is mandatory to have one if the course has at least 15 students.
- The role of a lecturer is to facilitate the class rep selection process and not to impose a candidate to the class.

- We will run the class rep election on Ed Discussion!
- I will open a post where candidates can post their motivations. Then, we will proceed to a vote with a poll on Canvas if there are several candidates.

UNIVERSITY OF AUCKLAND
Waipapa Taumata Rau
NEW ZEALAND

Do you need help?

The University has a range of ways to get help if something has happened to you or someone you know.

Te Papa Manaaki, Campus Care

A safe, confidential and free service where a case manager will connect and guide you through relevant support services. You can be referred by others or reach out directly for advice.

auckland.ac.nz/campus-care

University Health and Counselling Services (UHCS)

Enrolled patients can book an appointment with a GP, nurse or counsellor. Visit the website for more info, including online enrolment.

auckland.ac.nz/studenthealth

Ratonga Hauātanga Tauira, Student Disability Services (SDS)

The team offer a range of services to make studying at the University an accessible and positive experience by tailoring support to suit each individual student.

disability.auckland.ac.nz.

Be Well

A range of general wellbeing self-help resources, to support your physical and mental health during your time at University.

auckland.ac.nz/be-well

Student Conduct Office

The primary reference point for all matters relating to student general misconduct, including your options for reporting and available support.

auckland.ac.nz/student-conduct

Complaints and incidents

This is where you can submit a complaint, provide feedback or report an incident to the University.

auckland.ac.nz/complaints-and-incidents

Alcohol and Drug Clinician

Confidential alcohol and drug advice and appointments are available for all students.

auckland.ac.nz/aod-clinician

Rainbow Support Adviser

Provides a holistic approach to student wellbeing for the rainbow community, offering 1:1 support and group opportunities for discussion.

equity.auckland.ac.nz/rainbow

Spiritual and religious support

The team can provide holistic pastoral care and wellbeing. They offer inclusive, compassionate support whether you have a faith or are exploring how spirituality and religion could be a part of your life.

auckland.ac.nz/spiritual-support

AUSA Advocacy

The team provide free, independent, professional advice if you are struggling with an academic, financial or personal issue.

ausa.org.nz/support/advocacy

HELP Centre

A private and confidential service providing specialist support for sexual abuse survivors. Search 'HELP' on the University website for information on the drop in service.

Phone: 0800 623 1700 (available 24/7)
helpauckland.org.nz

Puāwaitanga Counselling

A service run by trained counsellors and available to all students, providing support with feelings of anxiety, relationships, grief, addiction and more.

Phone: 0800 782 999 (7 days a week 9am-9pm)
Visit auckland.ac.nz and search 'Puāwaitanga'.

Be Well
Whai Hauora

Your To-do list

- If not done already, get familiar with the course Canvas page, and join the Ed Discussion forum for the course.
- Make sure you are up-to-date with the programming prerequisites before Tutorial 1 on Thursday.
- Make sure you have a laptop and you installed the necessary software (see on Canvas).
- For potential class reps: submit your motivations on Ed Discussion (once I create the post).

Course and extra resources

- Books / Websites / Repositories (see Course Resources & Recommendations Canvas page)
- The Batch - Newsletter (DeepLearning.ai) → Weekly AI quiz (not graded) in Tuesday lecture
- AI Explained - YouTube Channel

THE BATCH
What Matters in AI Right Now

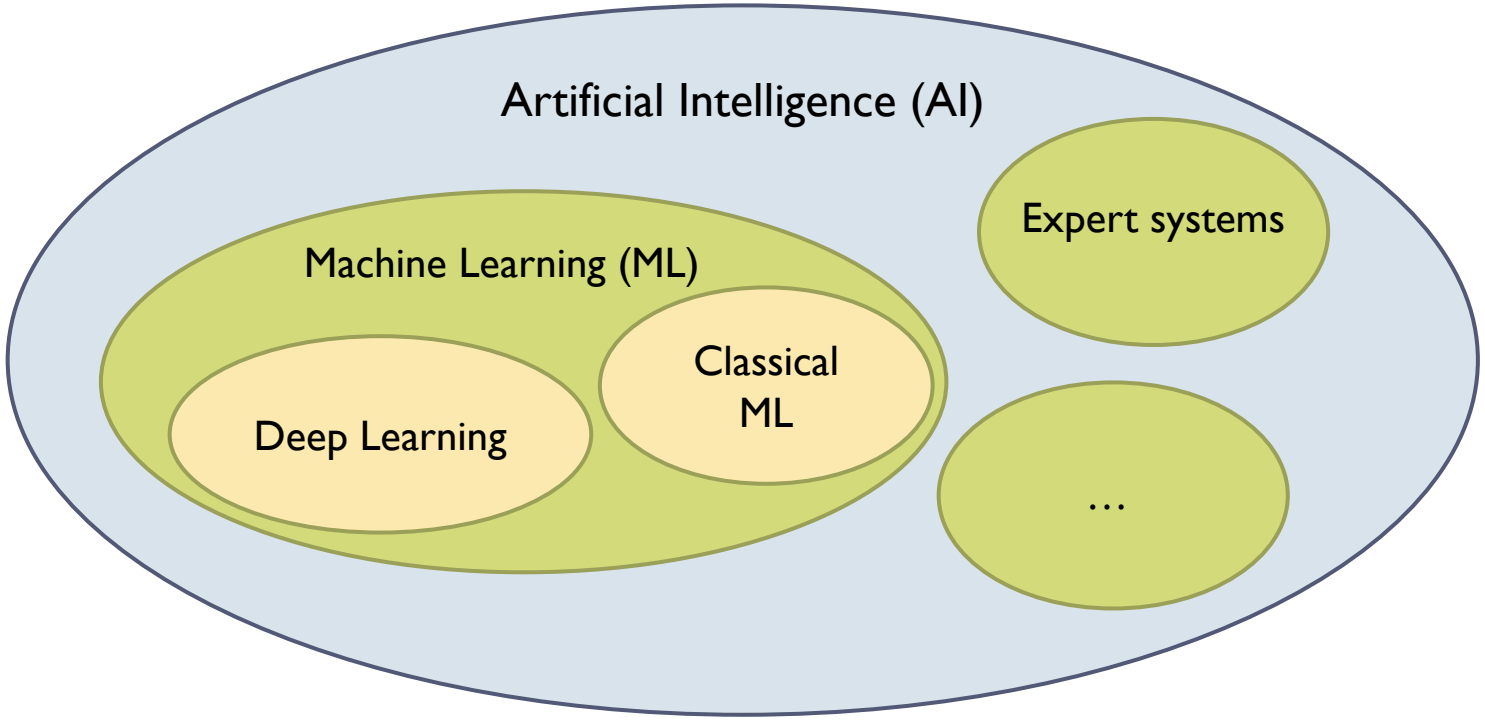
AI EXPLAINED

Your feedback is valuable!

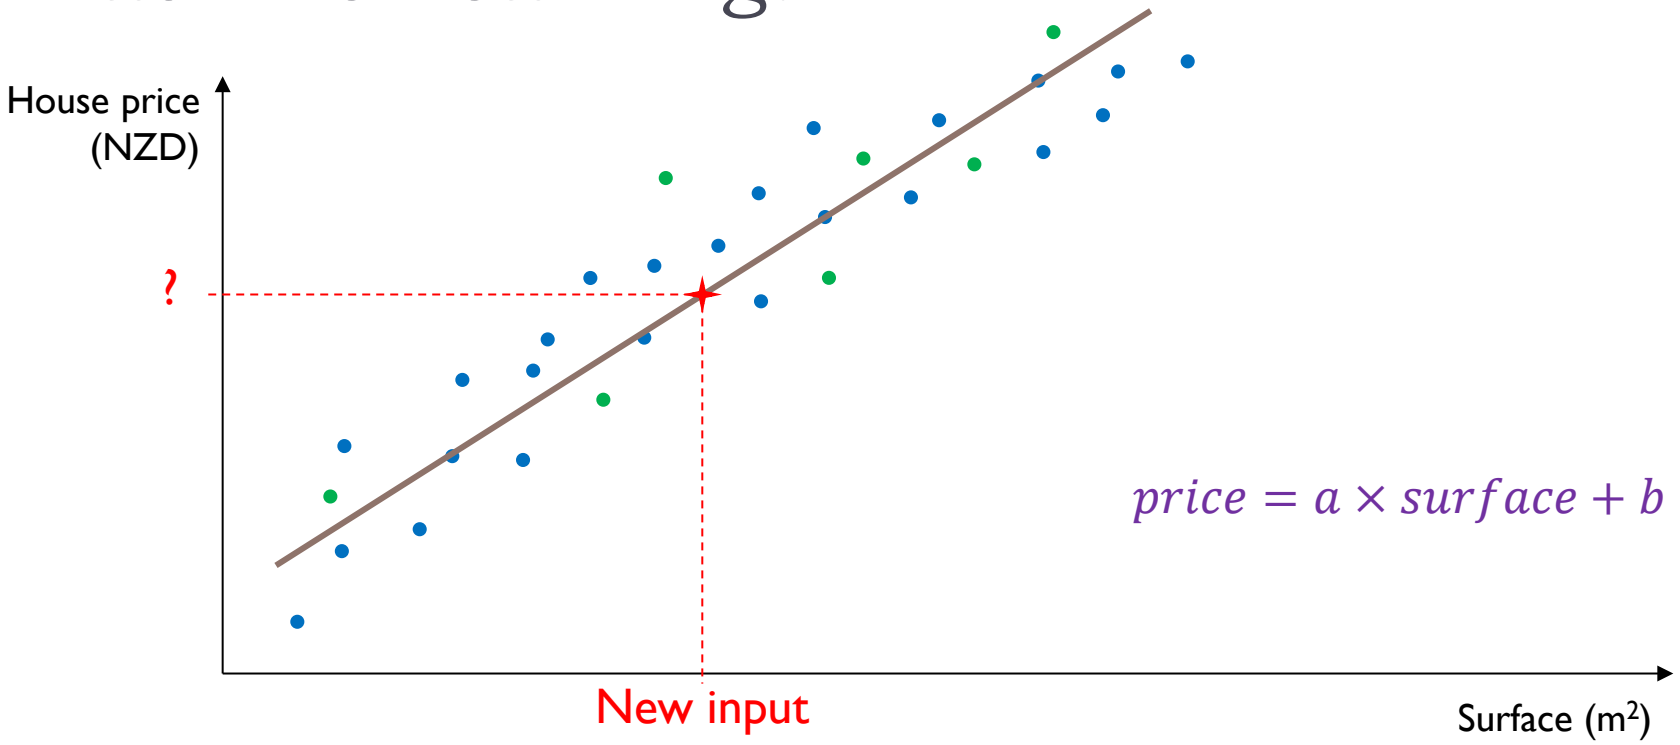
- This is the second iteration of the course, so we welcome your feedback to improve it in the future ☺
- Feedback should preferably be passed by:
  - Talking to your class rep so that they can report it to us
  - Filling the SET Evaluations (at the end of the semester)

Let's define AI first

- Artificial Intelligence: "The science and engineering of making intelligent machines", John McCarthy, 1955
- Machine Learning: Field of study focusing on algorithms which enable the computers to learn from data, and even improve themselves, without being explicitly programmed.
- Deep Learning: subset of machine learning methods based on artificial neural networks (ANNs) with representation learning.

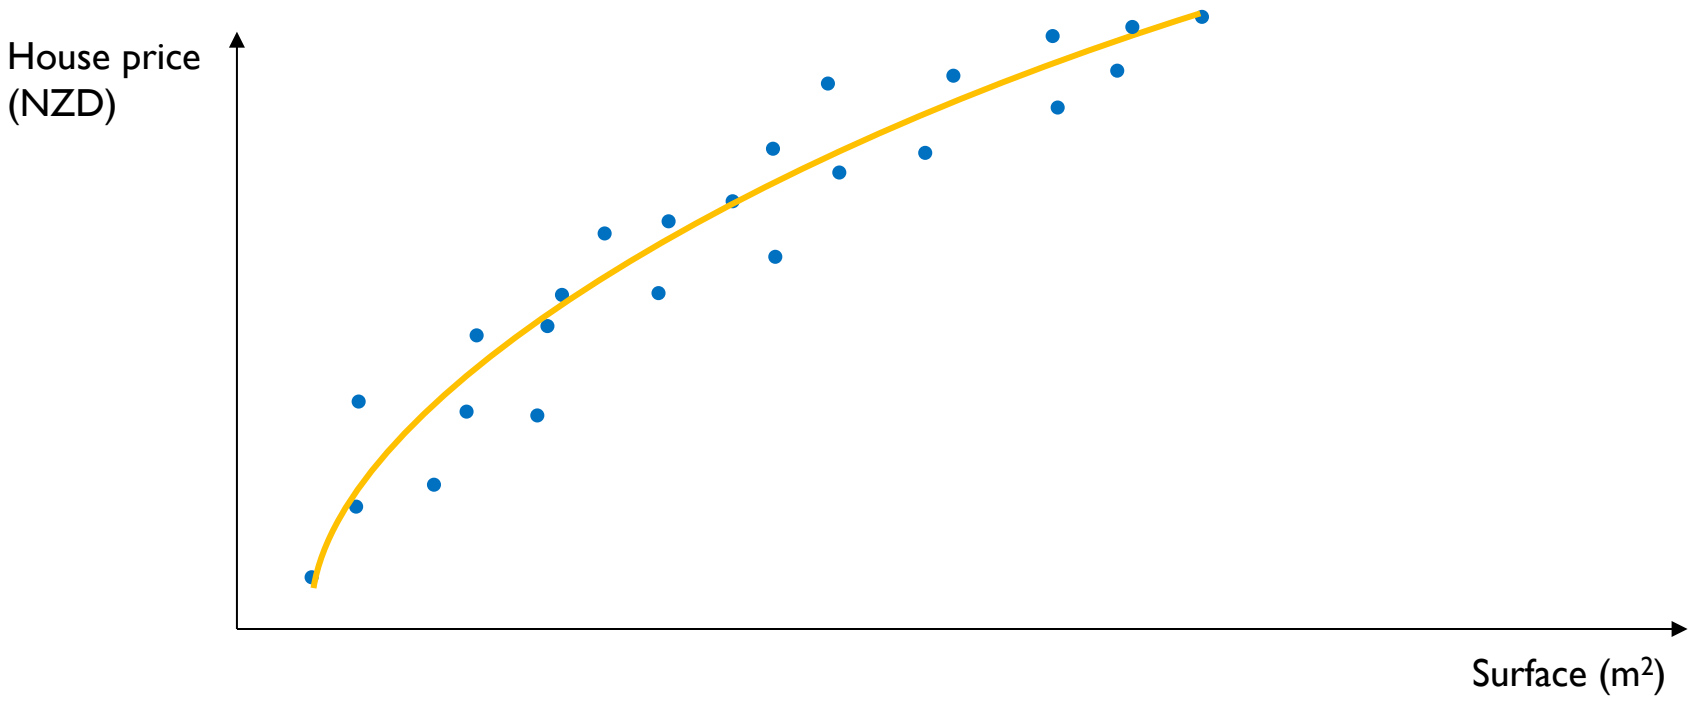


What is Machine Learning?



$$price = a \times surface + b$$

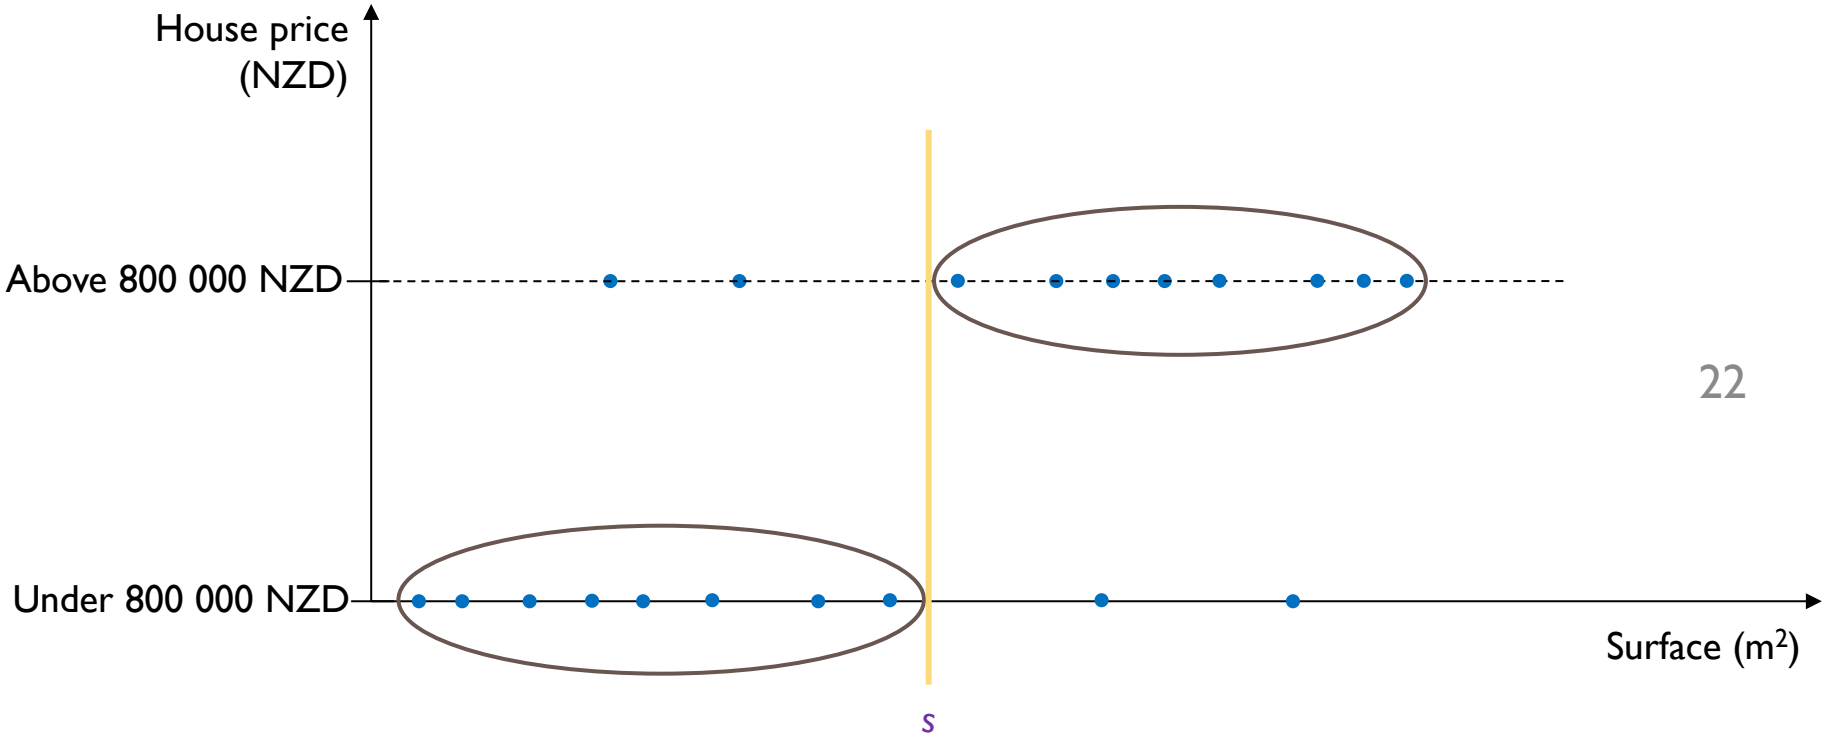
1) ML algorithms aim at uncovering *patterns* in a set of *training data* (e.g., mapping inputs and outputs).
2) A *model* is created out of the uncovered patterns.
3) The model's performance is tested with *test data*.
4) If performances are satisfactory, the model can be used to predict new inputs.



- Relationship between inputs and outputs can be linear or not.
- Several types of ML algorithms can be used to build models (e.g., Linear Regression).

Classification vs Regression problems

- Regression problem → predicting continuous/numerical values.
- Classification problem → predicting discrete/categorical values.



Types of Machine Learning

Supervised learning

- Train a model for a specific task using labelled data (e.g., classify cats and dogs images).
- Can be used for classification or regression.
- Methods include: Linear Regression, K-Nearest Neighbor, Decision Tree, Random Forest, Support Vector Machine, Neural Network.

Unsupervised learning

- Train a model to discover patterns and relationships in unlabelled data (e.g., identify different customers behaviours).
- Clustering methods include: k-means, DBSCAN.
- Dimensionality reduction methods include: PCA, LDA, t-SNE.

Reinforcement learning

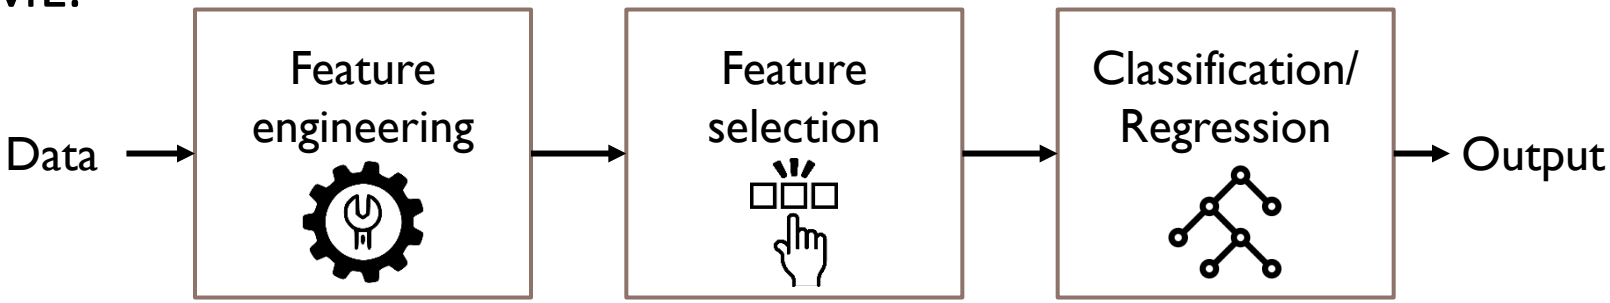
- Let an agent perform actions in an environment to maximize a reward (e.g., training a robot to move from point A to point B).
- Methods include: Monte Carlo methods, Q-learning.

Self-supervised learning

- Similar to supervised learning, but the labels are self-generated instead of given by humans.
- E.g., masking words sentences and training to predict the masked words.

Classical Machine Learning

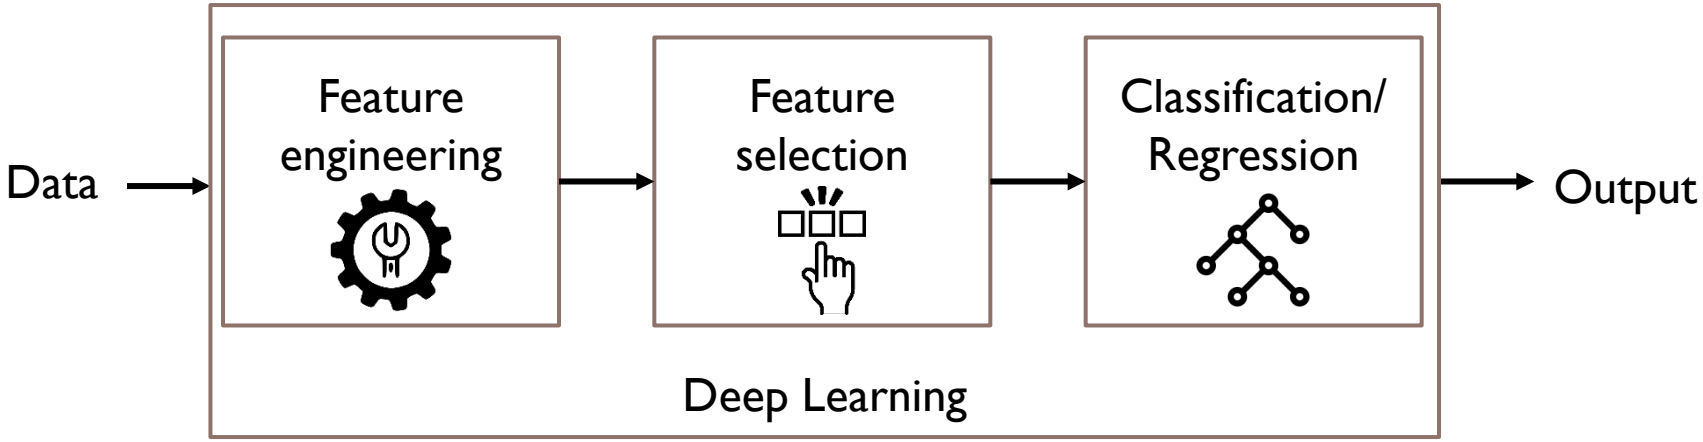
- The classical approach to ML:



- For example: Predicting house prices
  - Data → Webpages from realestate.co.nz
  - Extracted features → house's price, localisation, date of construction, size, owner's name, age, etc…
  - What features are relevant?
  - What regression algorithm?

Making these choices usually requires expert knowledge!

Deep Learning



- No need for manual feature engineering and feature selection.
- Feature generation and classification are both done by the same algorithm (Deep Neural Network), with the data as input.
- Scale well with the amount of training data but requires more computing resources.

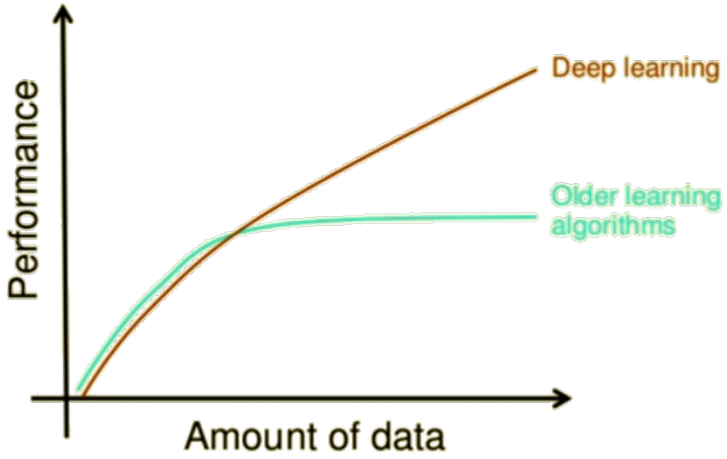
Deep Learning and AI systems

- The success of Deep Learning with Deep Neural Networks (DNNs) in the past decades led to the successes of modern AI systems.
- A lot of the recent major developments in AI systems rely on implementations using Deep Learning and DNNs (e.g., Large Language Models).
- We do not teach much about classical ML algorithms (e.g., random forest, SVM) in COMPSCI 714, but if you want to learn about them, you can take COMPSCI 762.

The death of classical Machine Learning?

The death of classical Machine Learning?

- Classical Machine Learning is still useful in some situations:



Small datasets

Low computational resources

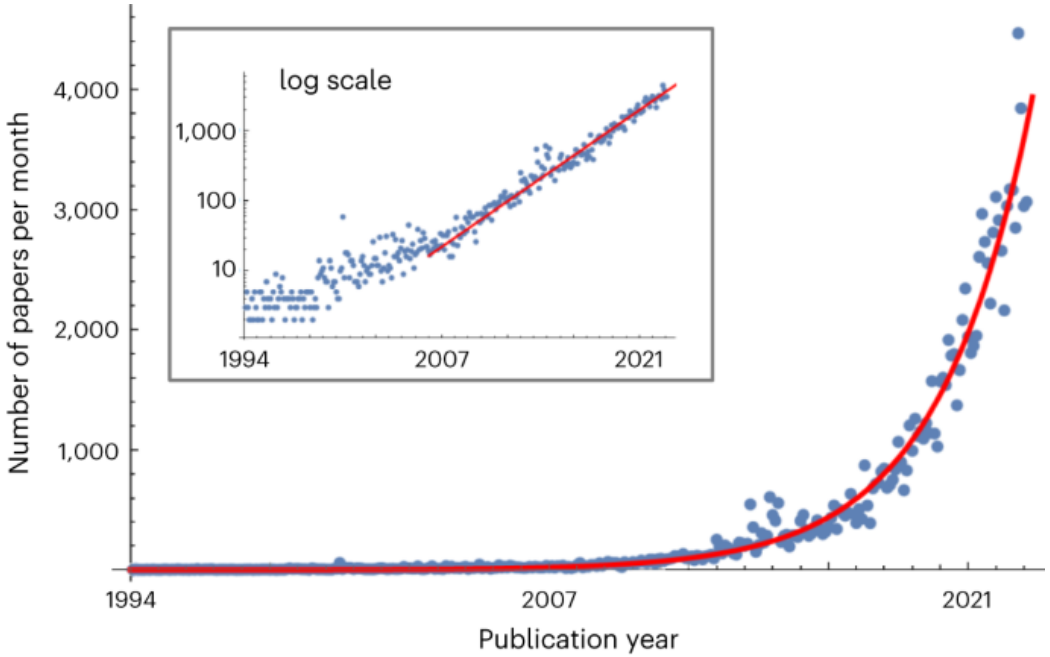
Ease of interpretation

Implementation choices for the course

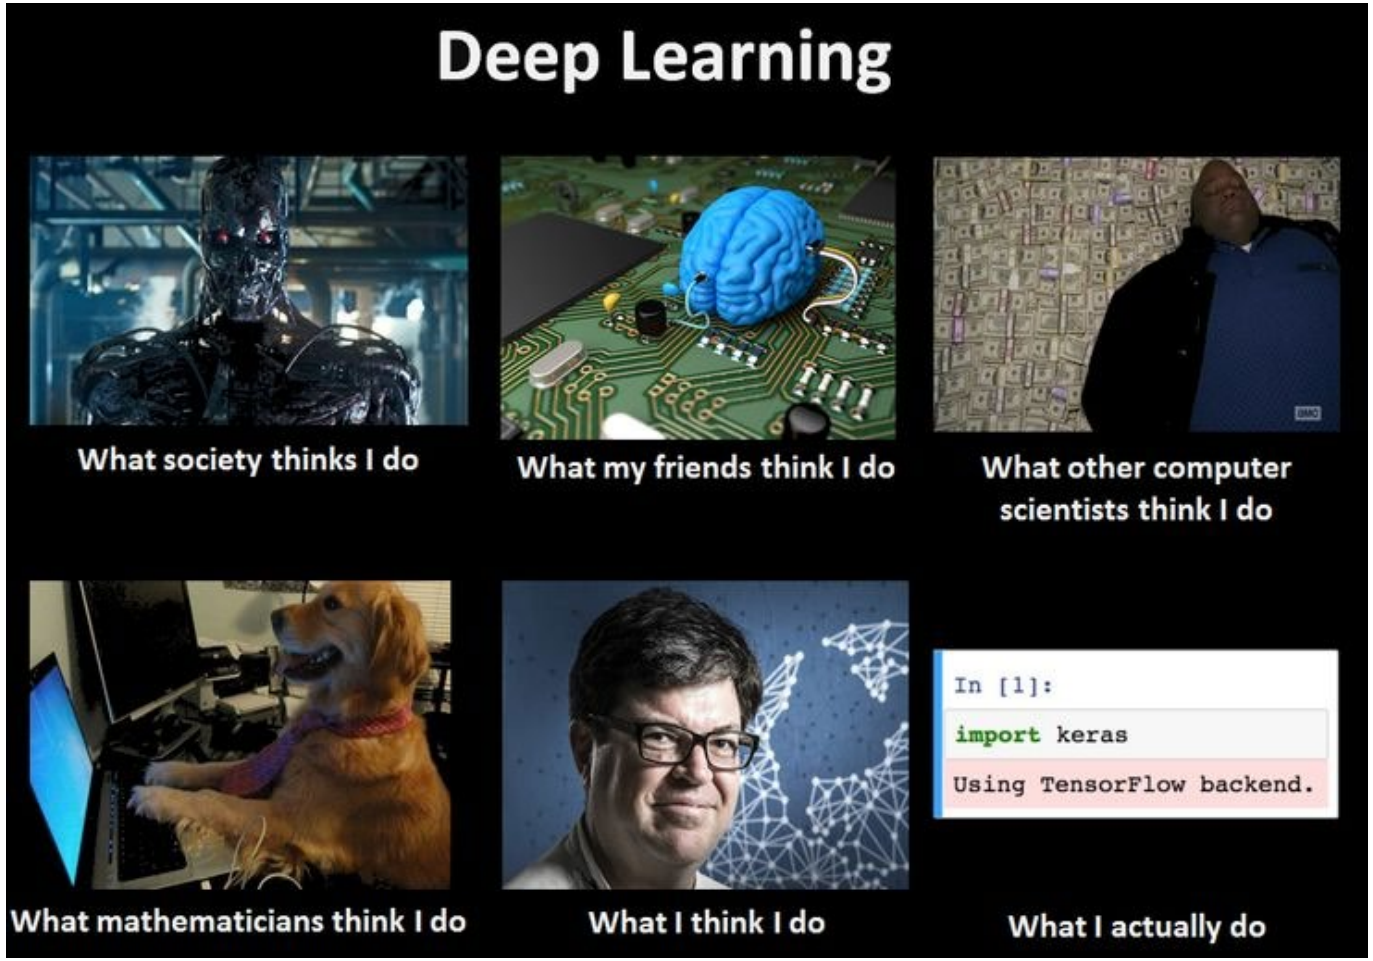
- Two main Python frameworks for Deep Learning implementation:
  - Pytorch (popular in research)
  - TensorFlow (popular in industry)
- There exists a huge amount of DNN open-source architectures.
- We will study a few well-known architectures, but a lot of variants exists.
- Most modern AI solution design is about choosing an existing architecture, relevant to the problem you are trying to solve, and « adapting » it to your problem (fine tuning).

A fast-paced field

- This course will give you a general understanding of the field.
- We will study some historically sucessful architectures, and some of the current State of The Art (SoTA) architectures.
- However, it is crutial that you build habits to keep up-to-date with the rapid developments of the field.



The number of papers published per month in the arXiv categories of AI and ML are growing exponentially.

Krenn, M., Buffoni, L., Coutinho, B. *et al.* Forecasting the future of artificial intelligence with machine learning-based link prediction in an exponentially growing knowledge network. *Nat Mach Intell* **5**, 1326–1335 (2023). https://doi.org/10.1038/s42256-023-00735-0


We hope you enjoy the course!
